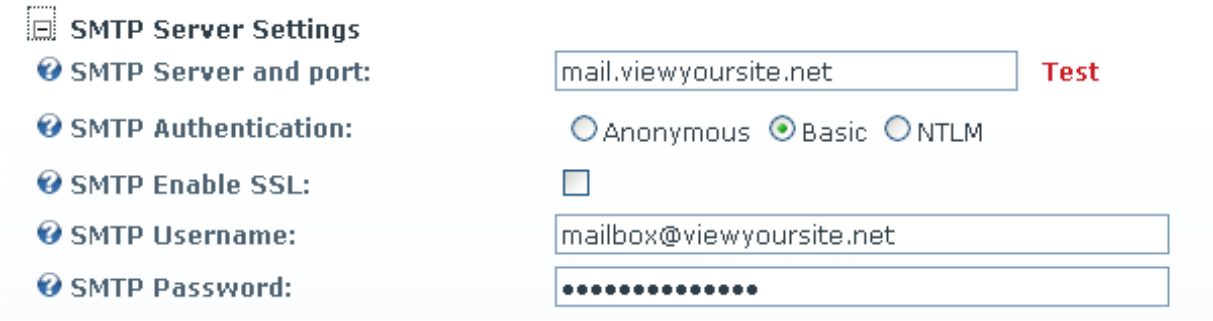
Introduction of the module

Custom Email form is a DNN Module to create custom or dynamic forms. You can create different type of form fields and group them into categories, sort them, Hide/ unhide them the way you want. You can optionally configure the form to be redirected to a different page after a successful submission

Prerequisites

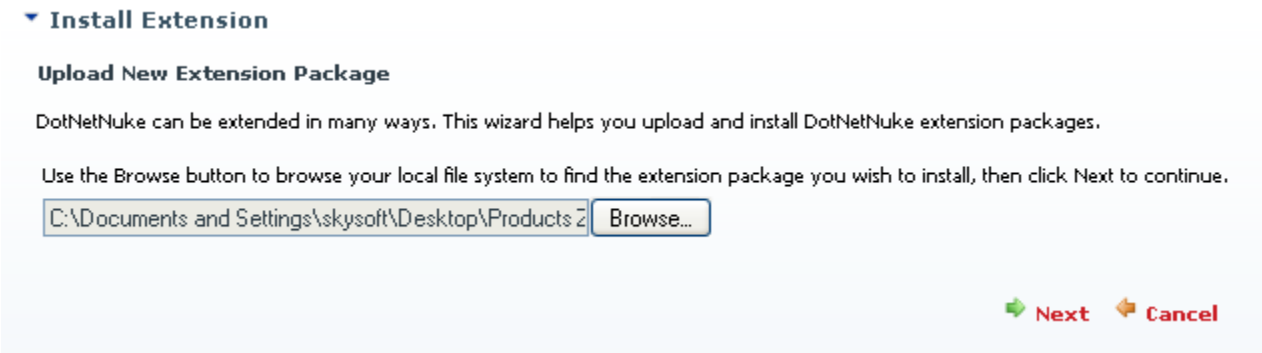
Configure SMTP Server

Prior to creating any form this is necessary to save some required settings to get the appropriate results, like for sending emails and saving that data to view saved data (explained below). For SMTP Server settings, Go to the Host → Host Setting →SMTP Server Settings and set required settings as shown below in the form.



Installation procedure

For installing your desired module do mouse over in the **host** link in main menu, click on **module definition**→go to the context menu and click on **install module**→ browse the desired module and install the module.



Install Extension
Upload New Extension Package
DotNetNuke can be extended in many ways. This wizard helps you upload and install DotNetNuke extension packages.
Use the Browse button to browse your local file system to find the extension package you wish to install, then click Next to continue.
C:\Documents and Settings\skysoft\Desktop\Products 2

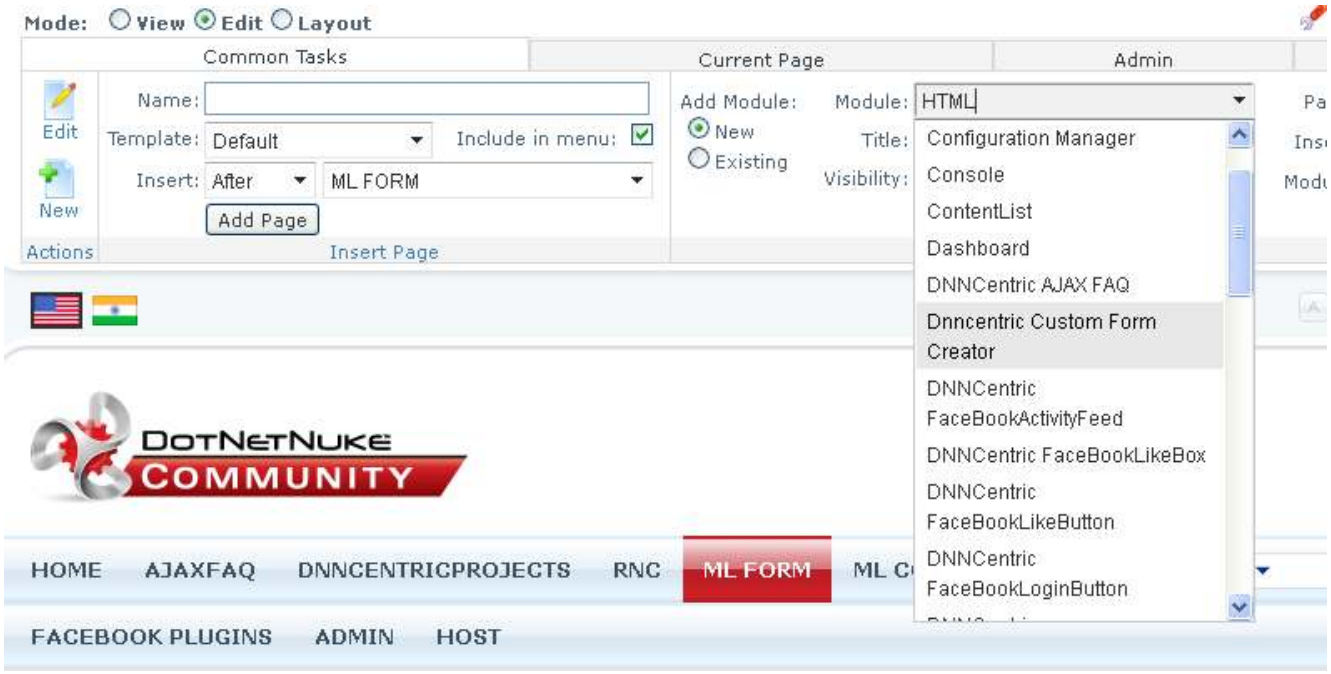
Creating Your First form

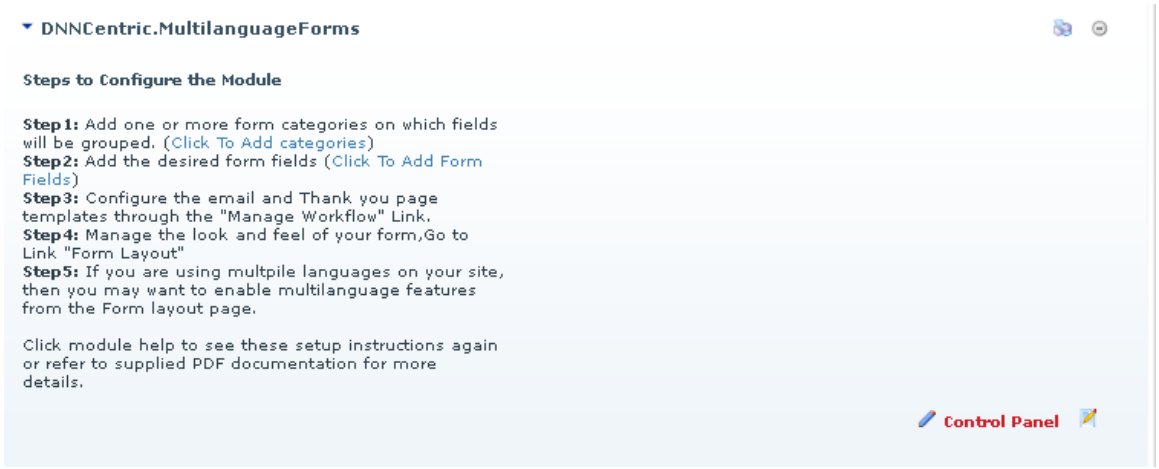
Adding custom form module to the page

In order to add "DNNCentric custom form" module to a desired page follows these steps:

- Select the "*Add New Module*" radio button.
- Choose "DNNCentric custom form" from the "*Module*" pull down menu.
- Click on the "*Add*" link



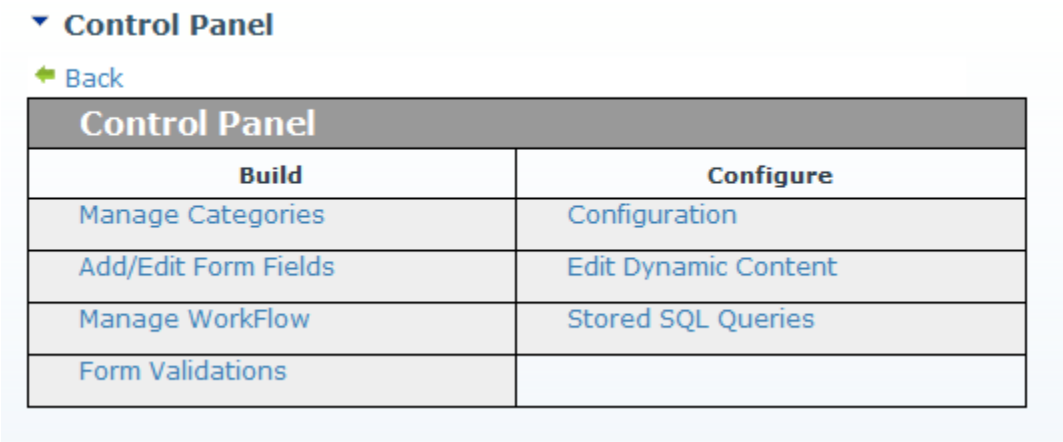
The DNNCentric Custom Form module will be added to the page. It will look like as-



DNNCentric.MultilanguageForms
Steps to Configure the Module
Step1: Add one or more form categories on which fields will be grouped. (Click To Add categories)
Step2: Add the desired form fields (Click To Add Form Fields)
Step3: Configure the email and Thank you page templates through the "Manage Workflow" Link.
Step4: Manage the look and feel of your form,Go to Link "Form Layout"
Step5: If you are using multpile languages on your site, then you may want to enable multilanguage features from the Form layout page.
Click module help to see these setup instructions again or refer to supplied PDF documentation for more details.
Control Panel

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd

When you click on the control panel it will look like as-



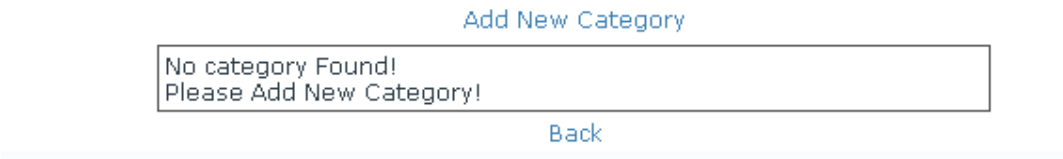
Manage Categories

What is a category

You can group one or more form fields in different categories. For e.g. you can create categories like “Personal Information”, “Professional Details”.

How to add a new Category?

To access Add / Edit category user interface page go through the manage category link into the action menu bar, you will access the below page.



Click to the add new category link to add categories in your form.After clicking on that link u will get to the below form.

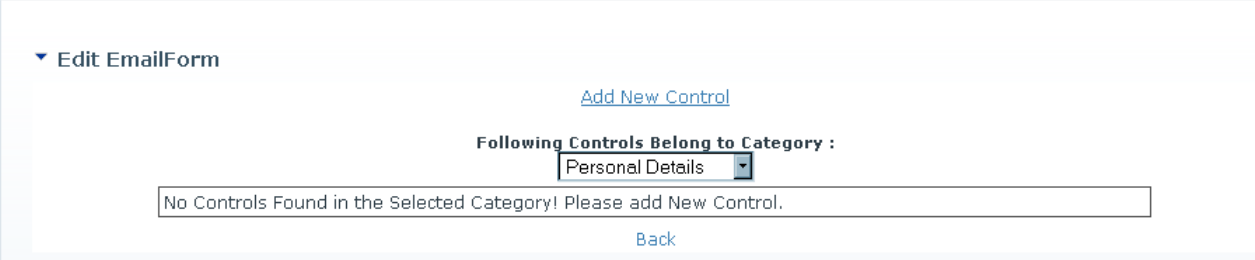
 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd

Add all required categories one by one in your form.

Sorting and Editing a category

You can sort, delete and edit categories from here.

Go back to the main page and click on the "Add/Edit Form Fields'' link from the context menu. You will get to the below form



Edit EmailForm
Add New Control
Following Controls Belong to Category :
Personal Details
No Controls Found in the Selected Category! Please add New Control.
Back

Add/Edit Form Fields

What is a field.

Click on Add New Control to get the next page where you will be able to add new controls in your custom form. This form contains the all fields that may be used to build the form. These are

Control Type
Field Name
Category
Active

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd

Properties (according to the control type)
Text Properties
Caption
Default Value

All these fields are explained below.

Control Type: Control Type enables user to choose required control type with given list of controls, accordingly properties of that control enables and asks user to set properties according to their need.

Field Name: This feature becomes use for uniquely identify fields for internal use of form fields. That cannot be changed once saved.

Category: Choose category accordingly in which controls to be added.

Active: Check this box to make the field control active.

Properties: Properties of controls change according to control type has been chosen in the form. This is a very useful feature which helps user to set fields value according to their need and according to their control type.

Text Properties: Text property is a section in which two fields are there, both of them detailed below.

Caption: This is a text field in which user inserts field name what he/she wants to identify for particular field.

Default Value: Here we can define default value for any particular field.

Here I am explaining all the control types and properties which populates automatically while selecting control type.

Sr. No.	Control's Name	Description	Enabled Properties	
1	**Text Box**	You can use Text box control where you want to give textual input.	As you select a textbox control, certain properties enables, these are.	
			Text Mode	You can choose single line or multiline dropdown list according to your need

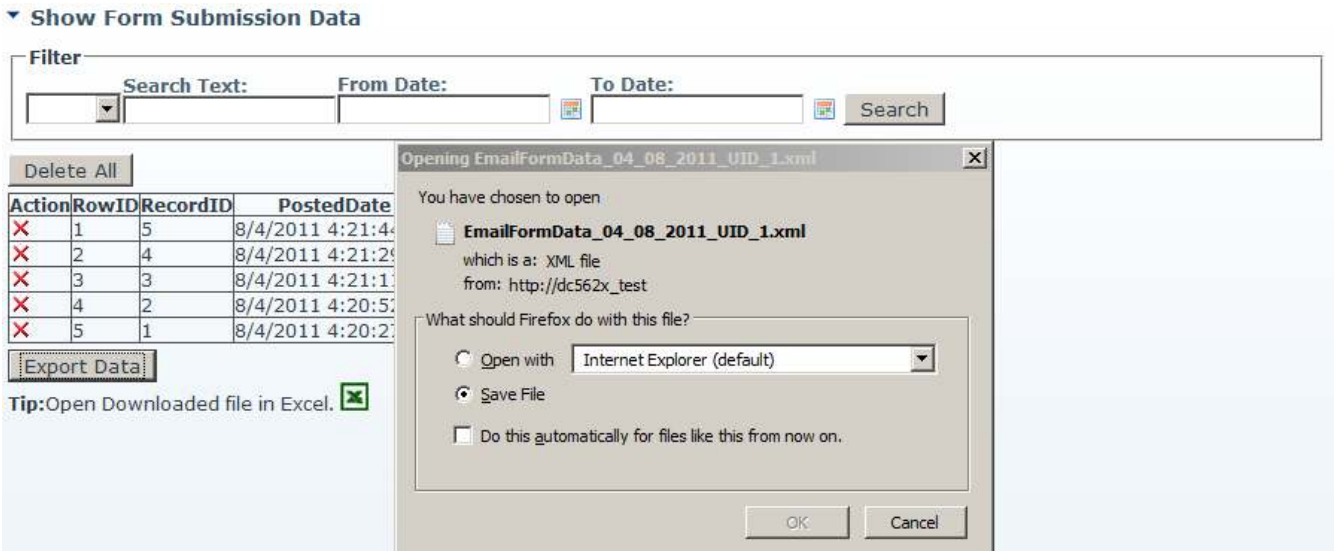
Export Data
Tip:Open Downloaded file in Excel.
Back

This form shows the submitted data in a grid and by the help of 'Export Data' button you can export data in XML and can open downloaded data in excel sheet form.

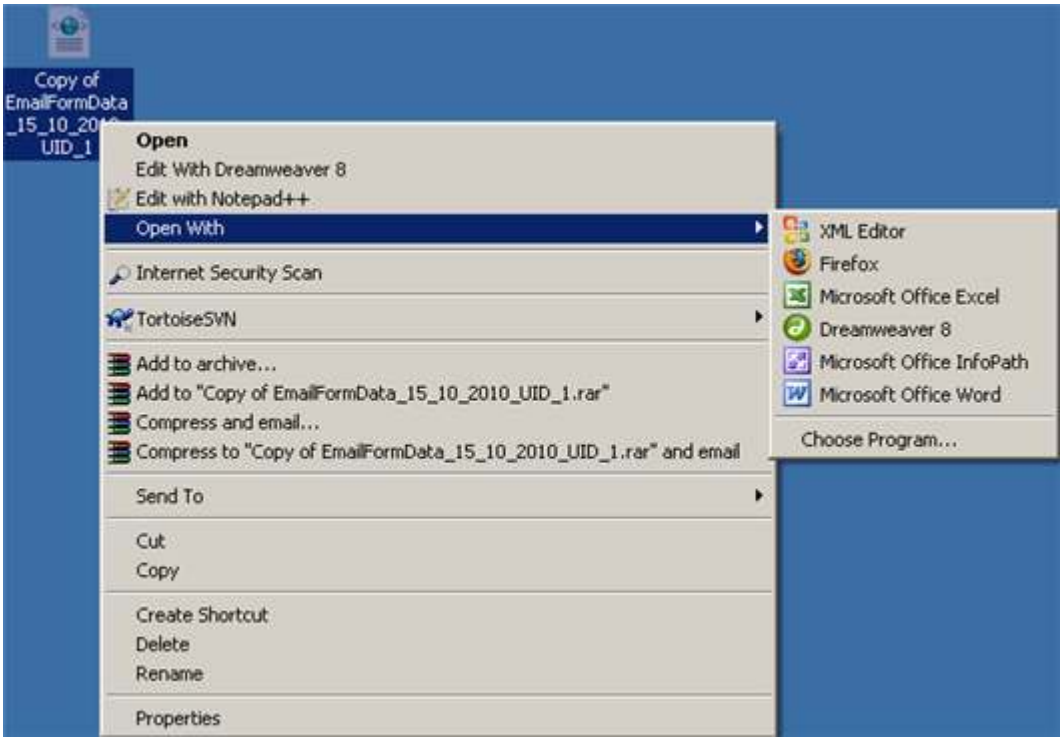
 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd

Follow these steps to download data and exports in excel 2003 and in excel 2007

Click on Export data button to get the below shown image

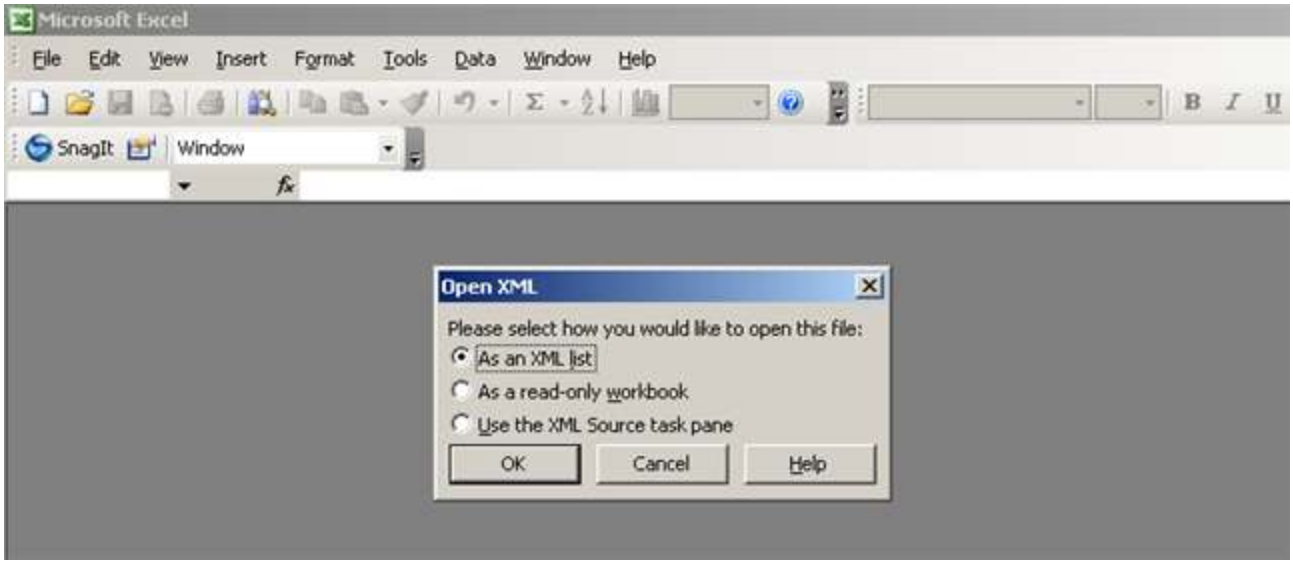


Save that file and open it with Microsoft office excel like in below shown image

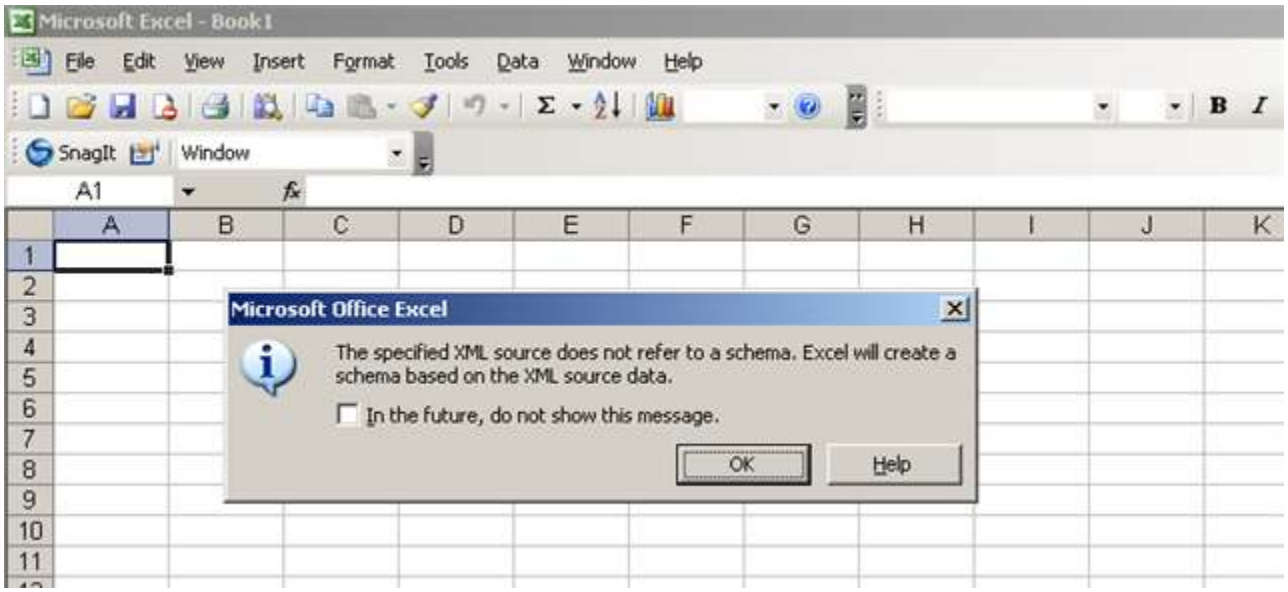


After opening it with MS Excel you will get to the below shown user interface

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd



Choose As an XML table option and click on Ok button. You will get to the below shown user interface.



Microsoft Excel - Book1

Manage Email WorkFlow

In order to send a mail it is necessary to add work flow for current language.
In order to add new work flow go to the Add/Manage work flow link from the context menu, in new page click on Add New Workflow link to get the below form.

Two tokens have been used for configuring emails. These are

1. $(AutoFieldValuelist)

   Use this token to get a readymade table of all the fields and corresponding values. **Tip:** To format Auto Generated table, edit EmailTable.css file.

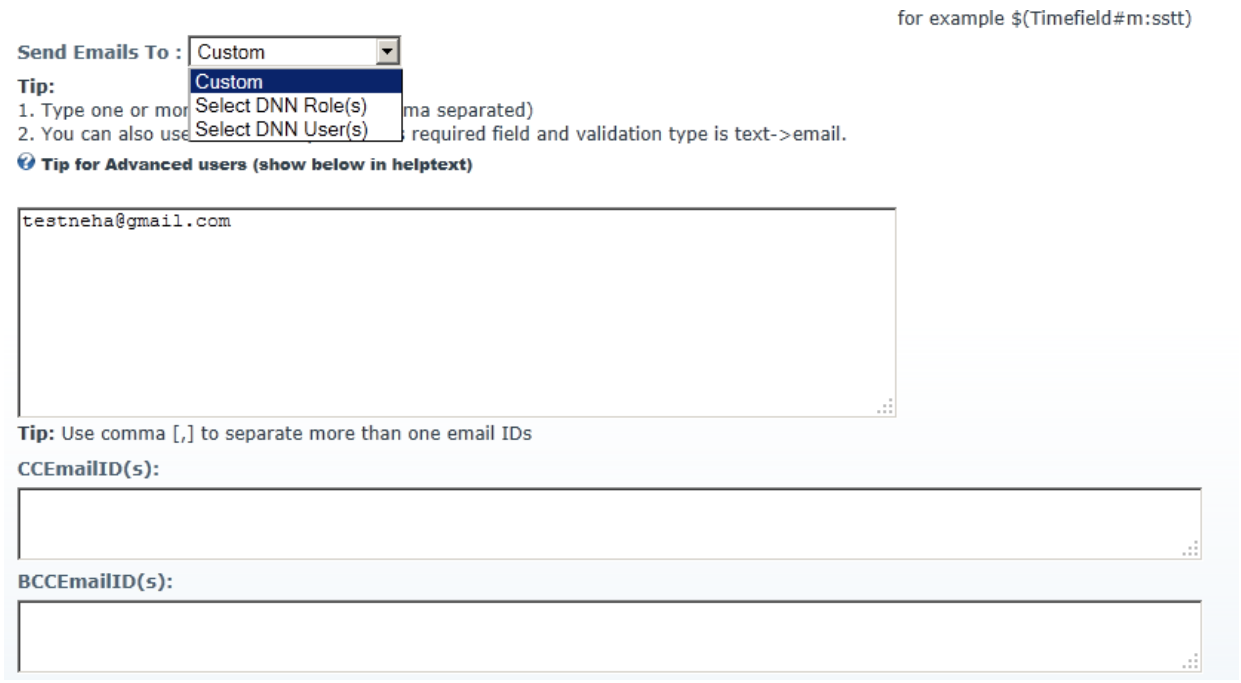
2. $(FilledInFieldValueList)

   Use this token to get a readymade table of only those fields and their values that are filled in before the form is submitted.

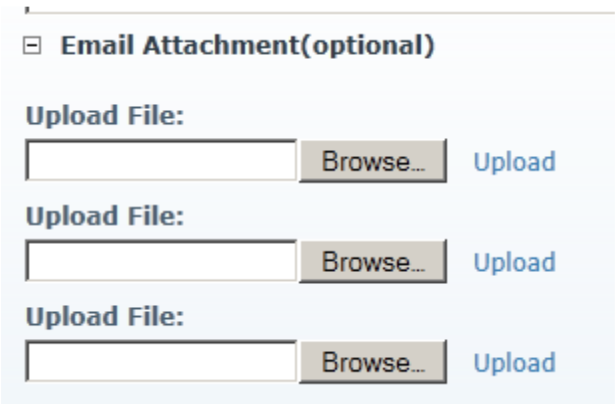
   Tip: To format Auto Generated table, edit EmailTable.css file.

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd



In this form you have options to customize the from address field and to address field, as well as you can create new template, as required. You can use Available Email Tokens. Put the token in the text area of send email to and Update.

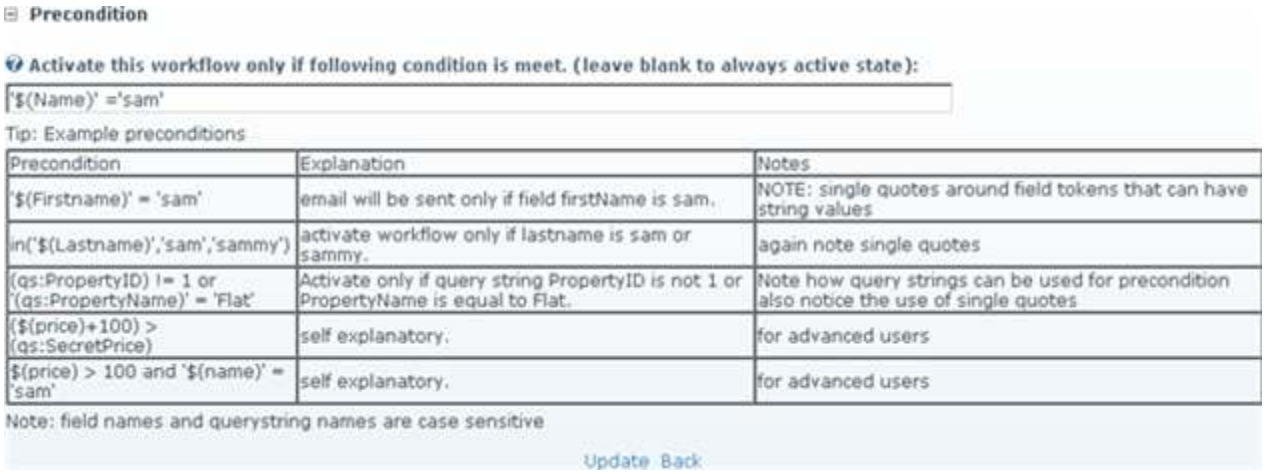


These Email Attachment Fields is use to Upload a file. These fields are Optional.

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd

In this form you have option to enable the appointment by click on the checkbox. You can use Available Tokens. . Put the token in the text area of Date Start, Start Time, Date End, End Time, Summary, Location, Description .Alarm trigger is used to declare the time of alarm.
Methods include publish and request.

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd



Precondition

Activate this workflow only if following condition is meet. (leave blank to always active state):

'$(Name)' ='sam'

Tip: Example preconditions

Precondition	Explanation	Notes
'$(Firstname)' = 'sam'	email will be sent only if field firstName is sam.	NOTE: single quotes around field tokens that can have string values
in('$(Lastname)','sam','sammy')	activate workflow only if lastname is sam or sammy.	again note single quotes
(qs:PropertyID) != 1 or '(qs:PropertyName)' = 'Flat'	Activate only if query string PropertyID is not 1 or PropertyName is equal to Flat.	Note how query strings can be used for precondition also notice the use of single quotes
($(price)+100) > (qs:SecretPrice)	self explanatory.	for advanced users
$(price) > 100 and '$(name)' = 'sam'	self explanatory.	for advanced users

Note: field names and querystring names are case sensitive

Update Back

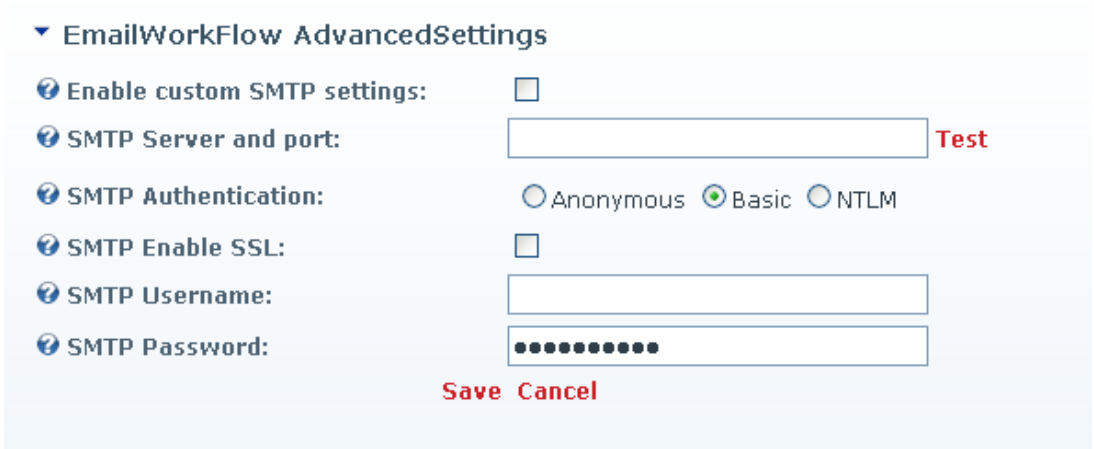
Precondition (Optional): If Condition in the Text-box is meet then Workflow Run otherwise not; it means Email will send when condition is true otherwise not.

These conditions are also Token Supported. You can use Available tokens.
e.g. '$(Name)' ='Sam'

$(Name) is the Available token.

Default value is True means if you do not write anything in the Precondition text-box then Email-workflow run.

Custom SMTP: Custom SMTP is configuring for each workflow individually.
Prior to creating any form this is necessary to save some required settings to get the appropriate results, like for sending emails .For Custom SMTP settings, Go to the Individual Workflow → Modify Advanced Settings and set required settings as shown below in the form.



EmailWorkFlow AdvancedSettings

Enable custom SMTP settings:

SMTP Server and port: Test

SMTP Authentication: Anonymous Basic NTLM

SMTP Enable SSL:

SMTP Username:

SMTP Password: ••••••••••

Save Cancel

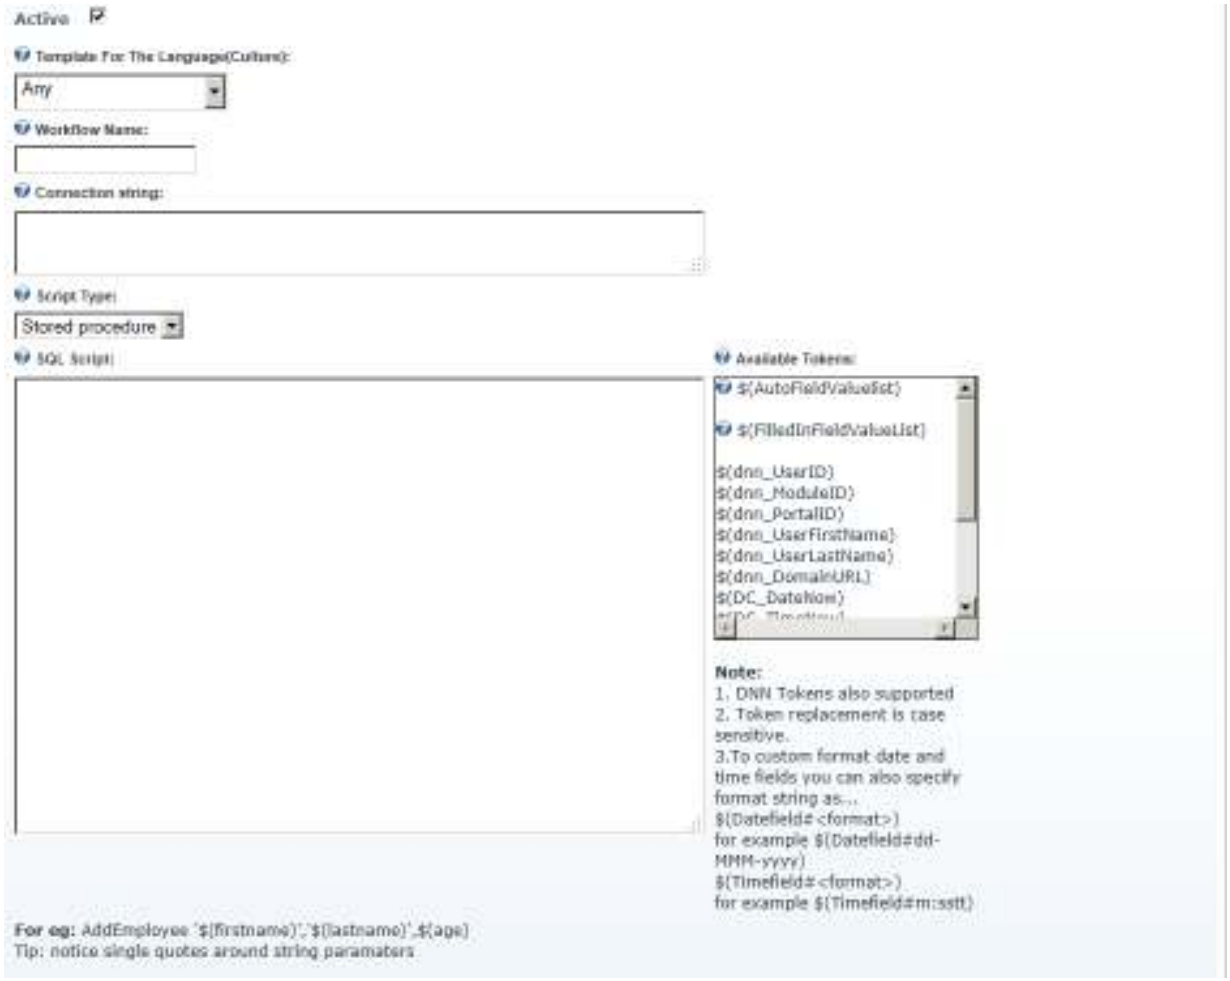
Manage SQL Post Workflow

In order to send a **Form Data** in a **Database** it is necessary to add Manage Post Data for current language. In order to add new Manage Post Data go to the Manage work flow link from the context menu, in new page click on Manage Post Data link to get the below form.

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd

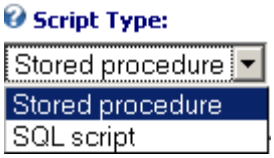


In this form you have five options.

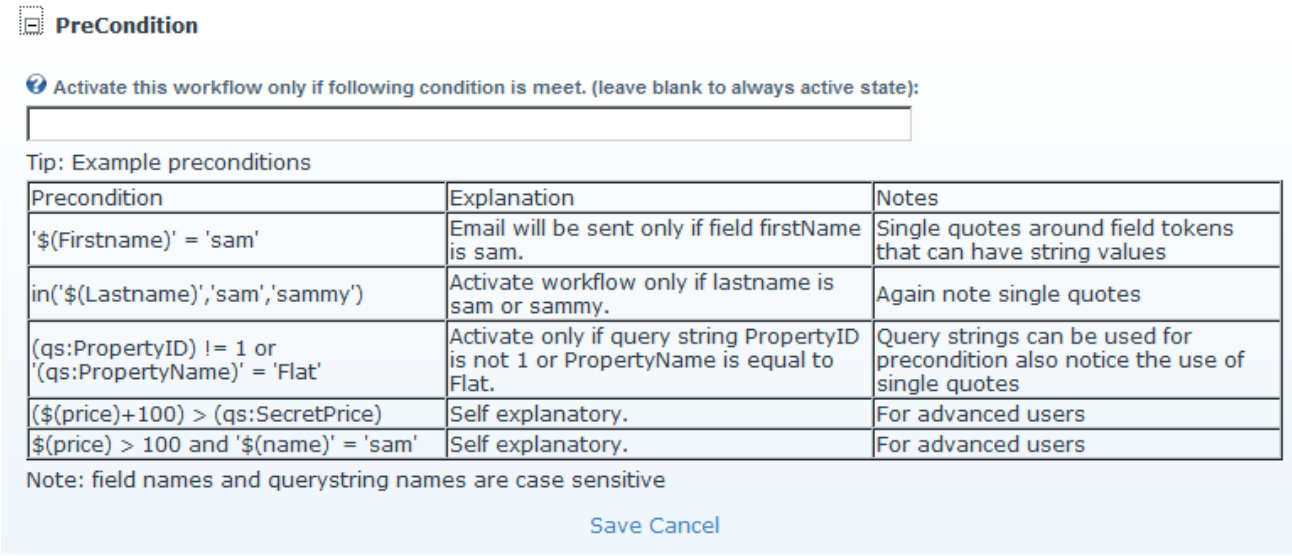
Template For The Language (Culture) :- This option is use to select culture for workflow

Workflow Name: - This option is use to type Postdate Workflow name.
Connection string: - In this field, use the **Workflow Connection String** which connect the values of form to the Data base.
Script Type: - Select query Type from dropdown list either Stored Procedure or SQL script.
SQL script: - This field is use to Connect the string from the external Data source

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd



You can use Available Email Tokens. Put the token in the text area of send email to and Update.



PreCondition
Activate this workflow only if following condition is meet. (leave blank to always active state):
Tip: Example preconditions
Precondition
Explanation
Notes
'$(Firstname)' = 'sam'
Email will be sent only if field firstName is sam.
Single quotes around field tokens that can have string values
in('$(Lastname)','sam','sammy')
Activate workflow only if lastname is sam or sammy.
Again note single quotes
(qs:PropertyID) != 1 or '(qs:PropertyName)' = 'Flat'
Activate only if query string PropertyID is not 1 or PropertyName is equal to Flat.
Query strings can be used for precondition also notice the use of single quotes
($(price)+100) > (qs:SecretPrice)
Self explanatory.
For advanced users
$(price) > 100 and '$(name)' = 'sam'
Self explanatory.
For advanced users
Note: field names and querystring names are case sensitive
Save Cancel

Precondition (Optional): If Condition in the Text-box is meeting then sql query is executed otherwise not.
These conditions are also Token Supported. You can use Available tokens.
e.g. '$(Name)' ='Sam'

$(Name) is the Available token.

Default value is True means if you do not write anything in the Precondition text-box then Manage SQL Post workflow run.

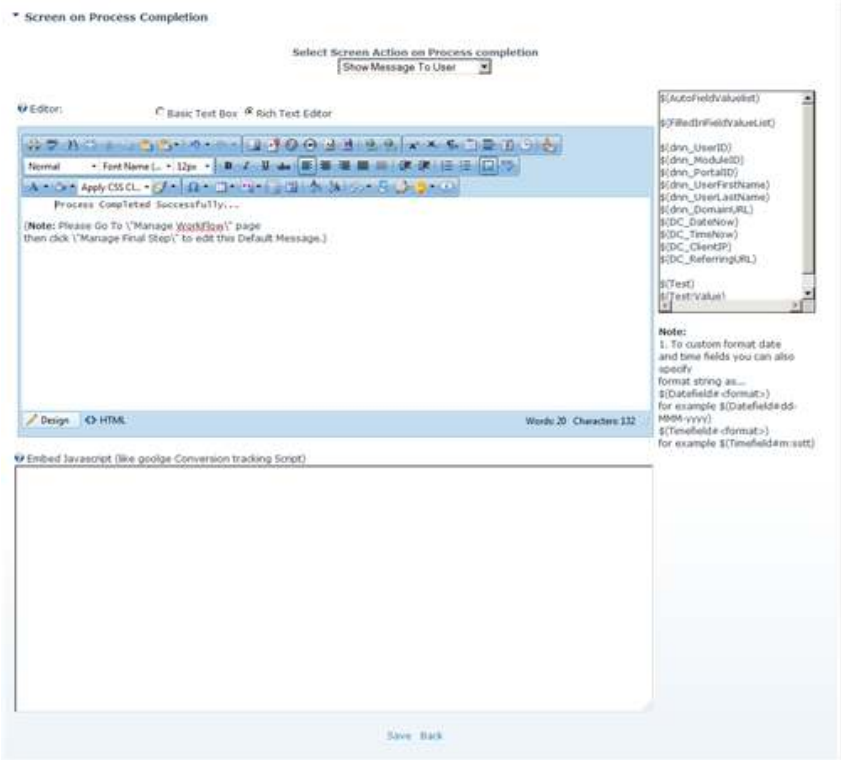
Manage Final Step /Redirecting to different pages

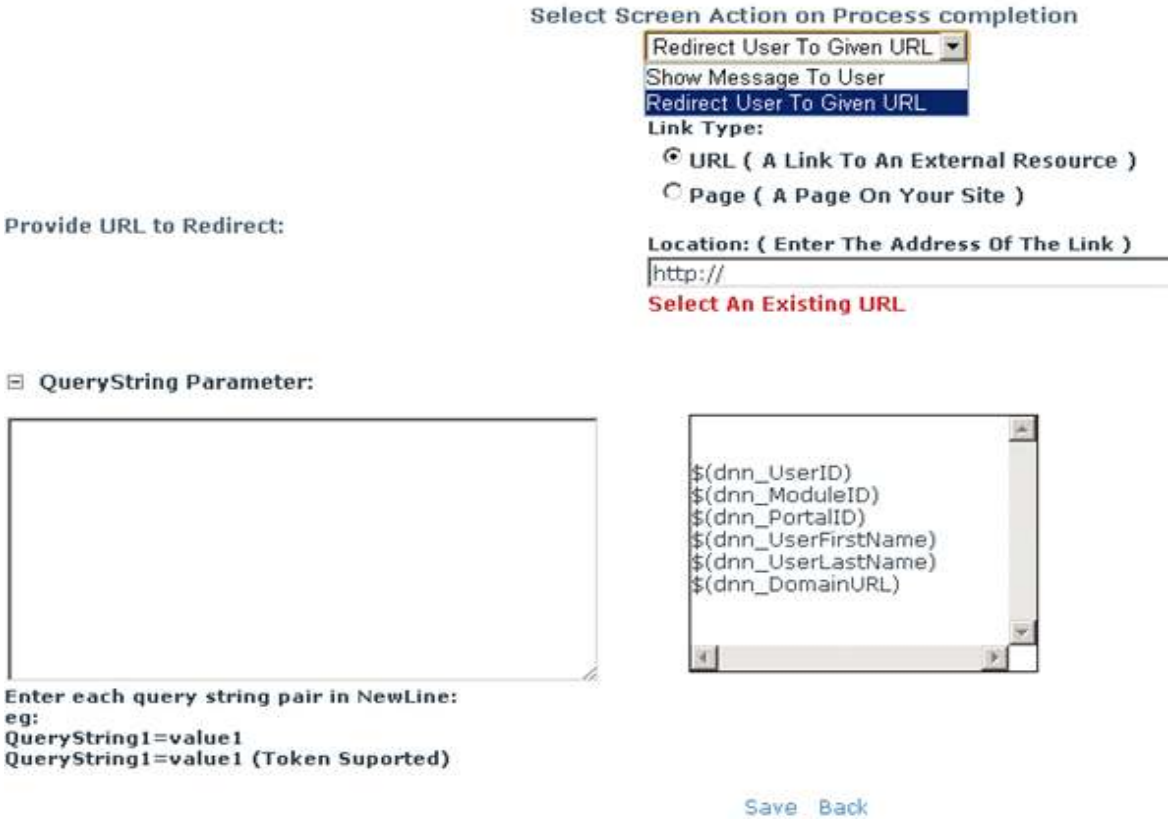
By simple click on the particular "*Manage Final step*" link .Here you can write any Response message or can redirect user to given URL. This form is used for selecting screen action on process completion; here we have a drop down box which enables to select options "Show Message to User" and "Redirect User to Given URL". Get to the below form select "Show Message to User" option from drop down.



By selecting "Redirect User to Given URL" below shown options enabled. Give the address of URL at given place, and after submitting the form, you will be redirect to that page.

You can also Query String Parameter. Enter each query string in New Line. For Example
QueryString1=value1
QueryString1=value1 (Token Supported)

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd



Configuration

In this page you can change your form layout as per your convenience. There are so many settings exist in this page. You can customize general settings in general Form layout option; also you can customize Form UI, captcha settings, and error format. One important feature is Customize Submit button, if you want to upload a new file or image you can simply click on the image Button and a dropdown comes up. In dropdown select Upload New and a new file upload control comes up through this you can simply upload your desire file.

Form width and allignments

To customize form's width and alignment property go to the Configuration option from the context menu and expand the General Settings option, here you can customize caption
Position, form alignment, form width, Send emails asynchronously and some other properties.

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd

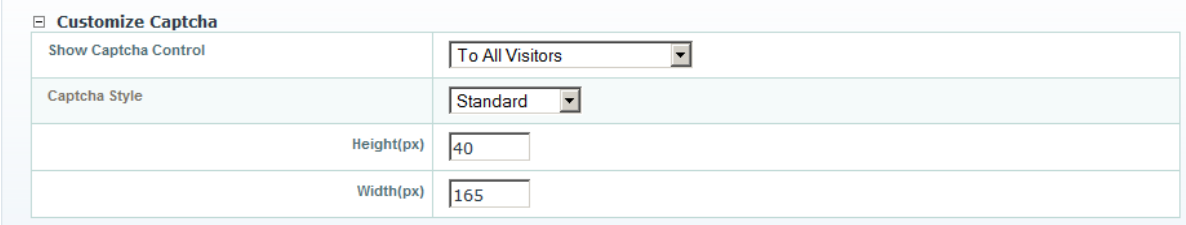
Quickly changing form colors

To customize Form UI you should to go to the Form Layout option from the context menu and expand the 'customize Form UI' option. This option gives facility to change the form elements color according to user needs, like you can change header text color, form background color, caption text color and header background color. As well as you can customize font size/text size and alignment properties from here.You can also customize the watermark caption color and font.

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd

Customizing Captcha

One of the important security features which user can add in his/her forms is captcha control. To get the captcha control, go to the Configuration option from context menu and expand customize captcha option. Here you can enable and disable captcha control through **Show Captcha Control** option. It allows choosing one option from dropdown box. Another option enables user to enable Standard or Recaptcha control.



Customize Error and Validation

In this feature you can Customize Error and Validation format in a very easy way. To get the Customize Error and Validation control, go to the Configuration option from context menu and expand customize captcha option. This setting use for required field validate .To enable this setting, Click on **Show Required field Indicator** check-Box.

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd

Customize buttons

Customize submit button gives facility to set the button's alignment, button type and One important feature in Customize Submit button option is if you want to upload a new file or image you can simply click on the image Button and a dropdown comes up. In dropdown select Upload New and a new file upload control comes up through this you can simply upload your desire file.

File Upload Path Setting

File upload path setting gives facility to fix a file path for uploading.

Advanced Configuration

Expand/collapse of category

This special property enables user to make expanded or collapsible categories in the forms. To enable this feature go to the Form Layout option from the context menu and expand the General Form layout option. Choose yes or no in the **Category Section Collapsible** option according to your need.

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd

Error Display template

In this module you can customize error format in a very easy way. To customize error display message use the error message template, where you can add your own characters with already given tokens, also you can customize error message panel position with given **Error Message Panel Position** property.

Secret of Default field values

Here we can define default value for any particular field.
This field allows general text and
DNN Tokens- e.g. [User:FirstName] [User:LastName]
Session variable- e.g.session:variableName

Viewstate variable- e.g.viewstate:variableName

querystring- e.g. querystring:VariableName

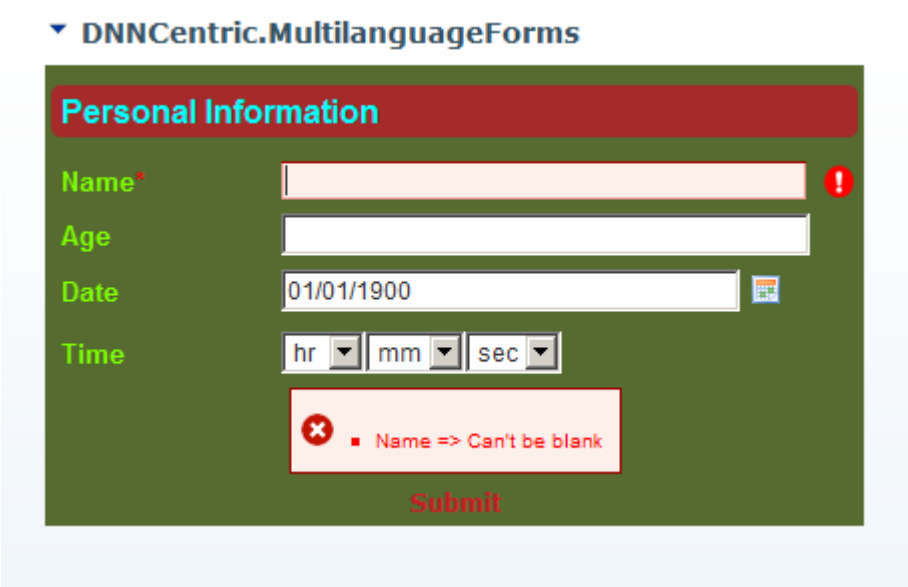
Edit Dynamic Content

To edit default dynamic content go to the, **Edit Dynamic Content** from context menu, here you will find a dropdown box which enables to select the option in which you want to edit the content, and these options are **Submit Image Button, Error Messages(s), Submit Button text, Clear Button Text, and Captcha Text.**

You can edit the default error message(s) as shown below image.

User screen showing localized error message

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd



Multilanguage features

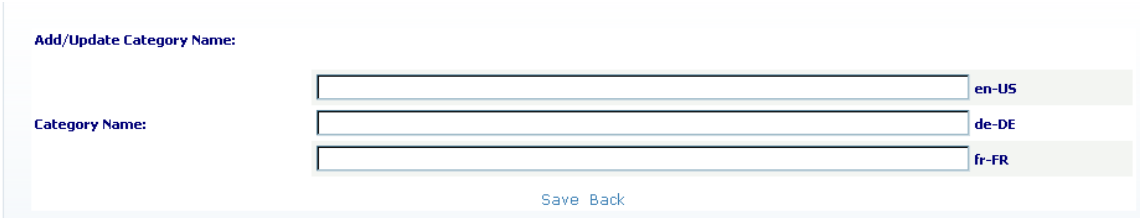
Enabling ML Features

In order to enable Multilanguage feature to your application go to the 'Configuration' link from context menu and check the 'Enable Multilanguage Feature' check box, as shown in the form.

 DNNCentric® Copyright © Skysoft IT Services Pvt Ltd

Effect on categories

After enabling the Multilanguage feature you'll be able to add same categories in other language too. As shown below in the form.



Effect on fields

As well as you can add controls in different language within relevant categories in your form. As shown below in the form.

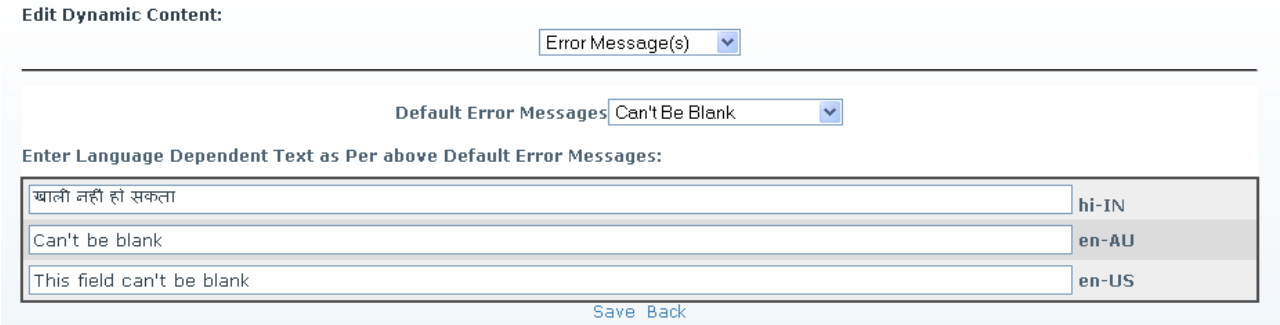
Effect on dynamic content

After enabling Multilanguage feature in your module, you will be able to do miscellaneous localization in default content, for example you can localize your error message as per your Language dependent. For example if you want to give an error message in US, Hindi and en(AU) also, you can simply select message from the dropdown and type its language dependent error message in the Textbox just like that



Similarly you can localized the other content too like submit button Text as shown in below image.

You can localized your submit button image too as shown in below form
